

ABSTRACT OF THE DISCLOSURE

Systems and methods for providing dynamic loading of applications over a network, wherein the loading is seamless and is initiated by a television. In a networked system that includes a television for rendering programming and a remote computer device having an application, the television dynamically determines that at least a portion of a remote application is needed and utilizes a network file system protocol to dynamically obtain the portion from the remote computer device, wherein the portion is obtained so as to be transparent to the view of the television and as needed by the television.
